PROFESSIONAL SUMMARY

Senior Java Software Engineer with 10+ years building scalable backend systems with Java and Spring Boot across fintech, banking, telecom, and iGaming. Strong expertise in microservices, distributed systems, databases, messaging, performance optimization, and architectural decision-making. Experienced in modernizing legacy systems, building reliable, maintainable products, and leading Java development teams. Focused on high-load, distributed backend systems and technical leadership.

CORE TECHNICAL SKILLS

Backend & Frameworks: Java 17+, SQL, Spring Boot, Spring Cloud, Spring Data, JPA, Hibernate, Spring Security
System Architecture: Microservices, Distributed Systems, Event-Driven Architecture, DDD, CQRS, Clean Architecture, REST/SOAP APIs
Data & Persistence: PostgreSQL, MongoDB, Redis, Elasticsearch
Messaging & Streaming: RabbitMQ, JMS ActiveMQ, Apache Kafka
Cloud & Infrastructure: AWS (EC2, RDS, S3, Lambda), Kubernetes, Docker, Helm, Terraform
Observability & DevOps: Prometheus, Grafana, ELK, OpenTelemetry, DataDog, Git, GitHub Actions, GitLab CI, CI/CD pipelines
Testing & Quality Assurance: JUnit, Mockito, Testcontainers, WebMvcTest, unit / integration / end-to-end testing, code review
Build Tools: Maven, Gradle

PROFESSIONAL EXPERIENCE

Senior Java Software Engineer | Atlaslive Apr 2024 – Present

Risk Management & Retail Platform Modernization *(iGaming)*

- Developed and modernized business-critical backend services for iGaming across Risk Management, Retail System, Bonus and other platform domains, focusing on scalability, reliability, performance, and technical debt reduction.
- Designed and implemented core functionality including regulatory integrations, external provider capabilities, and client-specific platform enhancements.
- Migrated payment infrastructure from legacy to modern Payment Gateway architecture; redesigned cross-service workflows and message routing to reduce coupling and improve request efficiency.
- Developed core business and operational system functionality including monitoring, messaging, notifications, and CRM integration.
- Optimized performance-critical requests through Redis caching and query optimization; improved latency, resource utilization, and system stability under increasing data volumes.
- Migrated services to Java 21 and RabbitMQ 4.0 infrastructure with Spring Boot updates; optimized Kubernetes HPA and CPU/memory allocation for improved resource efficiency and scalability.
- Increased test coverage to 80%+ across critical services; improved engineering practices around code quality, technical documentation, design, and pre-production validation.
- Investigated and resolved critical production issues across service boundaries, improving reliability of business-critical workflows.

Senior Java Software Engineer | Brightfin Sep 2022 – Jan 2024

TEM, MDM/UEM Platform Architecture & API Integration *(Telecom)*

Worked on TEM (Telecom Expense Management) and MDM/UEM (Unified Endpoint Management) systems with multiple provider integrations. Responsible for technical execution across the product lifecycle: from requirements clarification and system design through implementation, testing, infrastructure/deployment maintenance, and production support.

- Designed and implemented core microservices functionality for TEM and UEM platforms based on stakeholder requirements and cross-functional team collaboration.
- Led a team of Java developers after the previous lead left a project: coordinated team members, provided technical guidance, led communication with other teams, and performed technical design and code review.
- Developed integrations with multiple telecom carriers and MDM/UEM providers; implemented MACD processes and device enrollment workflows with device/accessory/pricing management capabilities.

- Supported a multi-cloud infrastructure-based project across AWS, GCP, and Azure in collaboration with the DevOps team.
- Established code-quality standards and documentation practices, including comprehensive test coverage, code review, Confluence documentation, and Swagger API specifications.
- Delivered new product features for customer acquisitions and platform expansion while providing ongoing customer support and issue resolution.

Java Software Engineer | Brightfin May 2021 – Sep 2022
API Integration & MDM Platform *(Telecom)*

Worked on API Integration and Mobile Device Management (MDM) platform development.

- Engineered core integration layer supporting diverse telecom provider APIs; designed workflows to improve system responsiveness for real-time usage calculation and inventory report operations.
- Developed device and accessory ordering functionality; implemented inventory catalog support and device lifecycle management features including enrollment, pricing, and feature management.
- Contributed to architectural transition from monolithic to microservices-based platform; improved scalability and enabled independent service deployment across the platform.
- Implemented comprehensive testing and documentation standards (Swagger API docs, technical specifications); maintained code quality through unit and integration testing best practices.
- Supported multi-cloud infrastructure, deployment pipelines, and production stability.

Java Software Engineer | MobiChord Mar 2018 – May 2021
MDM/Telecom Integration Platform *(Telecom)*

- Engineered integrations with major telecom carriers (AT&T, Verizon, T-Mobile, Telus) and enterprise MDM providers (Jamf Pro, MobileIron, Microsoft Intune, MaaS360, BlackBerry); managed full product lifecycle from requirements definition through production support.
- Developed new product features and enhancements for MDM/UEM backend platform.
- Implemented inventory reporting service with catalog support; enabled catalog management and vendor integration capabilities for device and accessory lifecycle.
- Established comprehensive testing practices including unit, integration, and end-to-end testing; improved code quality and enabled continuous integration and delivery pipelines for reliable feature deployment.
- Collaborated with cross-functional teams on requirements definition and system design; contributed to technical improvement proposals and platform evolution based on stakeholder feedback.

Junior Java Developer | Luxoft Apr 2016 – Mar 2018
Investment Banking & Trade Processing *(Banking)*

- Developed high-performance banking trade processing system for OTC derivatives; implemented event-driven order processing pipeline handling 10,000+ transactions daily with guaranteed order sequencing.
- Built regulatory reporting modules for investment banking platform; automated multi-system data aggregation reducing report generation time from 2 hours to 15 minutes.
- Integrated CRM system with banking backend; resolved data consistency issues through transaction management strategies, improving data accuracy.
- Designed and developed new banking application functionality; maintained existing systems and performed bug fixes.
- Developed Gradle build scripts and created web console for REST API using HTML5, CSS3, Bootstrap, and JavaScript/jQuery.

EDUCATION

Master's Degree in Mathematics
Drogobych Ivan Franko State Pedagogical University | Sep 2007 – Jun 2012

CERTIFICATIONS & LANGUAGES

Certifications: Google AI Professional Certificate; Java Design Patterns and Architecture
Languages: English – Professional Working Proficiency (B2 Upper-Intermediate); Ukrainian – Native
