Portfolio: jmarkuz.github.io

PROFESSIONAL SUMMARY

Senior Java Software Engineer with 10+ years of experience building backend systems with Java and Spring Boot in banking, telecom and iGaming. Specializes in microservices, distributed and high-load systems, event-driven messaging, PostgreSQL and performance optimization, with hands-on work on payments, risk management and regulatory integrations. Has led a Java team and mentored engineers; works test-first (TDD) in Agile / Scrum teams.

KEY ACHIEVEMENTS

- Payments (Atlaslive): Payment Gateway migration, ~48% fewer redundant external API calls, ~150 ms latency saved.
- Expansion (Atlaslive): implemented support for 2 sportsbook providers, Altenar and FIRST.bet, for LatAm operators.
- Platform (Atlaslive): 7 services upgraded to Spring Boot 4 / Java 25; test coverage up from ~60% to 80%+.
- Leadership (Brightfin): team of 3 Java developers; critical service migrated from monolith to microservices.
- Scale: 10,000+ transactions/day in guaranteed order (Luxoft); 9 carrier and MDM integrations (MobiChord).

TECHNICAL SKILLS

Backend, Frameworks & Build: Java 17 / 21 / 25, Spring Boot, Spring Cloud, Spring Data JPA, Hibernate, Spring Security, OpenFeign, Bucket4j, Multithreading / Concurrency, Maven, Gradle, Bazel

Architecture: Microservices, Distributed Systems, High-Load Systems, Event-Driven Architecture, System Design, DDD, CQRS, Clean / Hexagonal Architecture, REST / SOAP APIs, OpenAPI / Swagger, WebSocket

Data & Messaging: SQL, PostgreSQL, Redis, MongoDB, Elasticsearch, Liquibase, Flyway, RabbitMQ, ActiveMQ (JMS), Apache Kafka

Cloud & Infrastructure: AWS (EC2, RDS, S3, Lambda), Azure, GCP, Kubernetes, Docker, Helm, Terraform, Vault

CI/CD & Observability: GitLab CI/CD, GitHub Actions, Git, Datadog, Prometheus, Grafana, ELK Stack, OpenTelemetry

Testing & Quality: JUnit, Mockito, Testcontainers, WebMvcTest, SonarQube, Unit, Integration and End-to-End Testing

Practices: TDD, Spec-Driven Development, Agile / Scrum, Code Review, Mentoring, Technical Design

AI Coding Tools: AWS Kiro, Claude Code

PROFESSIONAL EXPERIENCE

Atlaslive | iGaming · Risk Management, Retail & Bonus Platform Modernization

Senior Java Software Engineer Apr 2024 – Present

- Re-architected a high-volume asynchronous settlement processing pipeline by splitting new and retry records into independent polling streams with dedicated thread pools and batch fetching from PostgreSQL, preventing retry backlogs from starving new transactions; rolled out via feature flags.
- Migrated payments from a legacy provider adapter to a Payment Gateway architecture with unified routing across services, reducing coupling; later moved to the gateway's v2 API.
- Designed a regulatory integration layer of REST APIs for several regulator types; extended provider integrations (credit, cash-out, free-bet flows) and built real-time bonus and campaign updates over WebSocket.
- Implemented support for 2 sportsbook providers, Altenar and FIRST.bet, evolving the platform in 2026 into a multi-sportsbook ecosystem for LatAm operators.
- Cut redundant external API calls by ~48% (97% cache hit rate, ~150 ms average latency saved) by introducing distributed Redis caching for Payment Gateway integrations (TTL-based, replacing a local cache); added a reactive Redis client with tuned timeouts.
- Removed performance bottlenecks in risk-management workloads: optimized PostgreSQL queries, added concurrently built indexes (no write blocking in production), tuned Kubernetes HPA, fixed lock contention with JPA / Hibernate pessimistic locking.
- Upgraded 7 services in stages: Spring Boot 3, Java 17 to 21, RabbitMQ 4.0, then Spring Boot 4 and Java 25.
- Raised critical-service test coverage from ~60% to 80%+ (JUnit, Mockito, Testcontainers); closed SonarQube findings.
- Fixed reliability and data-correctness defects (lost or skipped events, connection leaks, N+1 queries); investigated critical production issues across services (Datadog, Prometheus, Grafana, Elasticsearch).

Brightfin | Telecom · Telecom Expense Management (TEM) and device management (MDM/UEM) platform

Senior Java Software Engineer Sep 2022 – Jan 2024

Java Software Engineer May 2021 – Sep 2022

- Led a team of 3 Java developers after the previous lead left: technical design and guidance, mentoring, code review and coordination with other teams. Promoted to Senior in Sep 2022.
- Owned the TEM billing multi-upload feature end to end: design, testing, deployment and production support.
- Designed and built core microservices and REST APIs for the TEM and UEM platforms (device enrollment, provisioning, compliance reporting), using MongoDB for multi-tenant and billing upload configurations.
- Migrated a critical platform service from a monolith to microservices, enabling independent deployment and better resource use; part of the move to a Bazel mono-repo.
- Built rate limiting with Bucket4j and Redis against DDoS and resource abuse, and certificate management with Vault, including automatic updates.
- Built the integration layer for multiple carrier and MDM/UEM provider APIs, with asynchronous device-enrollment workflows (MACD: moves, adds, changes, disconnects).
- Tuned services on AWS, GCP and Azure with the AWS architect and DevOps, using Prometheus, Grafana and the ELK stack for monitoring and log analysis; sped up real-time usage calculation and inventory reports.
- Established team code-quality standards: code review, test coverage and OpenAPI / Swagger documentation.

MobiChord | Telecom · Device management (MDM) and carrier integration platform (merged into Brightfin, May 2021)

Java Software Engineer Mar 2018 – May 2021

- Designed and built 9 integrations with telecom carriers (AT&T, Verizon, T-Mobile, Telus) and MDM providers (Jamf Pro, MobileIron, Microsoft Intune, MaaS360, BlackBerry), covering enrollment, sync, wipe and activation.
- Built a carrier API service with MACD support (ordering, plan changes, roaming) and an inventory reporting service (MongoDB) with a device and accessory catalog.
- Built a mid-server for secure encrypted file transfer between SFTP and ServiceNow.
- Introduced unit, integration and end-to-end tests that enabled reliable CI/CD pipelines.
- Investigated and resolved critical production incidents using Prometheus, Grafana and the ELK stack.

Luxoft | Banking · Investment banking and trade processing

Junior Java Developer (started as Java Intern) Apr 2016 – Mar 2018

- Built an event-driven order-processing pipeline for an OTC-derivatives trade-processing system: 10,000+ transactions/day with guaranteed ordering.
- Automated multi-system data aggregation for regulatory reports, cutting report time from 2 hours to 15 minutes.
- Integrated a CRM system with the banking backend, using transaction management to keep data consistent; unified log aggregation across systems; wrote a reusable Gradle build plugin.

PERSONAL PROJECTS

ReadyBell (multi-tenant SaaS) | github.com/jmarkuz/ReadyBell
Order-ready alerts for restaurants: a QR code on the receipt opens a tracking page, and Web Push notifies when the order is ready, with no app or account needed. **Stack:** Java 21, Spring Boot 3.4, PostgreSQL, Redis, React, TypeScript.

Vacancy Tracker (self-hosted tool) | github.com/jmarkuz/vacancy-tracker
Job-search tool: collects vacancies on a schedule, removes duplicates, scores them with reasons and tracks every application. **Stack:** Java 21, Spring Boot 3.5, PostgreSQL, Flyway, Testcontainers.

EDUCATION

Master's Degree (MSc) in Mathematics, Drohobych Ivan Franko State Pedagogical University 2007 – 2012

CERTIFICATIONS

Google AI Professional Certificate, Google; Java Design Patterns and Architecture, Udemy
